5 The subsequent acylation is preferably carried out in a solvent such as methylene chloride, diethylether, tetrahydrofuran, toluene, dioxane, acetonitrile, dimethylsulphoxide or dimethylformamide, optionally in the presence of an inorganic or a tertiary organic base, preferably at temperatures between 20°C and the boiling temperature of the solvent used. The acylation with a corresponding acid is preferably carried out in the presence of a dehydrating agent, e.g. in the presence of isobutyl chloroformate, tetraethyl orthocarbonate, trimethyl  
10 orthoacetate, 2,2-dimethoxypropane, tetramethoxysilane, thionylchloride, trimethylchlorosilane, phosphorus trichloride, phosphorus pentoxide, N,N'-dicyclohexylcarbodiimide, N,N'-dicyclohexyl-carbodiimide/N-hydroxysuccinimide, N,N'-dicyclohexylcarbodiimide/1-hydroxy-benzotriazole, 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium-tetrafluoroborate, 2-(1H-benzotriazol-1-yl)-1,1,3,3-tetramethyluronium-  
15 tetrafluoroborate/1-hydroxy-benzotriazole, N,N'-carbonyldiimidazole or triphenylphosphine/carbon tetrachloride, and optionally with the addition of a base such as pyridine, 4-dimethylamino-pyridine, N-methyl-morpholine or triethylamine, conveniently at temperatures between 0 and 150°C, preferably at temperatures between 0 and 100°C, and the acylation with a corresponding reactive compound such as an anhydride, ester, imidazolide or  
20 halide thereof is optionally carried out in the presence of a tertiary organic base such as triethylamine, N-ethyl-diisopropylamine or N-methyl-morpholine at temperatures between 0 and 150°C, preferably at temperatures between 50 and 100°C

25 The subsequent esterification or amidation is expediently carried out by reacting a corresponding reactive carboxylic acid derivative with a corresponding alcohol or amine as described hereinbefore

30 The subsequent reduction of a nitro group is preferably carried out by hydrogenolysis, e.g. with hydrogen in the presence of a catalyst such as palladium/charcoal or Raney nickel in a solvent such as methanol, ethanol, ethyl acetate, dimethylformamide, dimethylformamide/acetone or glacial acetic acid, optionally with the addition of an acid such as hydrochloric acid or glacial acetic acid at temperatures of between 0 and 50°C, but

preferably at ambient temperature, and at a hydrogen pressure of 1 to 7 bar, but preferably 3 to 5 bar

5 The subsequent reduction of a cyano group is preferably carried out by hydrogenolysis, e.g. with hydrogen in the presence of a catalyst such as palladium/charcoal or Raney nickel in a solvent such as methanolic ammonia, ethanolic ammonia, ethyl acetate, dimethylformamide, dimethylformamide/acetone, dichloromethane or glacial acetic acid, optionally with the addition of an acid such as hydrochloric acid or glacial acetic acid at temperatures of between 0 and 50°C, but preferably at ambient temperature, and at a hydrogen pressure of 1 to 7 bar,  
10 but preferably 3 to 5 bar

In the reactions described hereinbefore, any reactive groups present such as carboxy, amino, alkylamino or imino groups may be protected during the reaction by conventional protecting groups which are cleaved again after the reaction

15

For example, a protecting group for a carboxyl group may be a trimethylsilyl, methyl, ethyl, tert butyl, benzyl or tetrahydropyranyl group and

protecting groups for an amino, alkylamino or imino group may be an acetyl, trifluoroacetyl, benzoyl, ethoxycarbonyl, tert butoxycarbonyl, benzyloxycarbonyl, benzyl, methoxybenzyl or  
20 2,4-dimethoxybenzyl group and additionally, for the amino group, a phthalyl group.

Any protecting group used is optionally subsequently cleaved for example by hydrolysis in an aqueous solvent, e.g. in water, isopropanol/water, tetrahydrofuran/water or dioxane/water, in  
25 the presence of an acid such as trifluoroacetic acid, hydrochloric acid or sulphuric acid or in the presence of an alkali metal base such as lithium hydroxide, sodium hydroxide or potassium hydroxide, at temperatures between 0 and 100°C, preferably at temperatures between 10 and 50°C

30 However, a benzyl, methoxybenzyl or benzyloxycarbonyl group is cleaved, for example, hydrogenolytically, e.g. with hydrogen in the presence of a catalyst such as palladium/charcoal in a solvent such as methanol, ethanol, ethyl acetate, dimethylformamide,

dimethylformamide/acetone or glacial acetic acid, optionally with the addition of an acid such as hydrochloric acid or glacial acetic acid at temperatures between 0 and 50°C, but preferably at ambient temperature, and at a hydrogen pressure of 1 to 7 bar, but preferably 3 to 5 bar

5 A methoxybenzyl group may also be cleaved in the presence of an oxidising agent such as cerium(IV) ammonium nitrate in a solvent such as methylene chloride, acetonitrile or acetonitrile/water at temperatures of between 0 and 50°C, but preferably at ambient temperature

10 A 2,4-dimethoxybenzyl group, however, is preferably cleaved in trifluoroacetic acid in the presence of anisole

A tert-butyl or tert-butyloxycarbonyl group is preferably cleaved by treating with an acid such as trifluoroacetic acid or hydrochloric acid, optionally using a solvent such as methylene  
15 chloride, dioxane, ethyl acetate or ether

A phthalyl group is preferably cleaved in the presence of hydrazine or a primary amine such as methylamine, ethylamine or n-butylamine in a solvent such as methanol, ethanol, isopropanol, toluene/water or dioxane at temperatures between 20 and 50°C.

20

Moreover, chiral compounds of general formula I obtained may be resolved into their enantiomers and/or diastereomers

Thus, for example, the compounds of general formula I obtained which occur as racemates  
25 may be separated by methods known per se (cf. Allinger N. L. and Eliel E. L. in "Topics in Stereochemistry", Vol. 6, Wiley Interscience, 1971) into their optical antipodes and compounds of general formula I with at least 2 asymmetric carbon atoms may be resolved into their diastereomers on the basis of their physical-chemical differences using methods known per se, e.g. by chromatography and/or fractional crystallisation, and, if these  
30 compounds are obtained in racemic form, they may subsequently be resolved into the enantiomers as mentioned above.

The enantiomers are preferably separated by column separation on chiral phases or by recrystallisation from an optically active solvent or by reacting with an optically active substance which forms salts or derivatives such as e.g. esters or amides with the racemic compound, particularly acids and the activated derivatives or alcohols thereof, and separating the diastereomeric mixture of salts or derivatives thus obtained, e.g. on the basis of their differences in solubility, whilst the free antipodes may be released from the pure diastereomeric salts or derivatives by the action of suitable agents. Optically active acids in common use are e.g. the D- and L-forms of tartaric acid or dibenzoyltartaric acid, di-o-tolytartaric acid, malic acid, mandelic acid, camphorsulphonic acid, glutamic acid, N-acetylglutamic acid, aspartic acid, N-acetylaspartic acid or quinic acid. An optically active alcohol may be for example (+)- or (-)-menthol and an optically active acyl group in amides, for example, may be a (+)- or (-)-menthyloxycarbonyl group.

Furthermore, the compounds of formula I obtained may be converted into the salts thereof, particularly for pharmaceutical use into the physiologically acceptable salts with inorganic or organic acids. Acids which may be used for this purpose include for example hydrochloric acid, hydrobromic acid, sulphuric acid, phosphoric acid, fumaric acid, succinic acid, lactic acid, citric acid, tartaric acid, maleic acid or methanesulphonic acid.

Moreover, if the new compounds of formula I thus obtained contain a carboxy group, they may subsequently, if desired, be converted into the salts thereof with inorganic or organic bases, particularly for pharmaceutical use into the physiologically acceptable salts thereof. Suitable bases for this purpose include for example sodium hydroxide, potassium hydroxide, cyclohexylamine, ethanolamine, diethanolamine and triethanolamine.

The compounds of general formulae II to V used as starting materials are known from the literature in some cases or may be obtained by methods known from the literature or are described in the Examples. For example, the compounds of general formula IV are described in German Patent Application 198 24 922.5 of 4<sup>th</sup> June 1998.

As already mentioned hereinbefore, the new compounds of general formula I wherein R<sub>1</sub> denotes a hydrogen atom or a prodrug group have valuable pharmacological properties, particularly an inhibiting effect on the proliferation of cultivated human cells, especially

tumour cells, but also on the proliferation of other cells, particularly endothelial cells, e g in angiogenesis

For example, the compounds listed in Table 1 were tested for their biological properties as follows:

## Test 1

### Inhibition of the proliferation of cultivated human tumour cells

Cells of the Leiomyosarcoma tumour cell line SK-UT-1B or non-small-cell lung tumour cell  
5 line NCI-H460 (obtained from the American Type Culture Collection (ATCC)) were  
cultivated in Minimum Essential Medium with non-essential amino acids (Gibco),  
supplemented with sodium pyruvate (1 mMol), glutamine (2 mMol) and 10% foetal calf  
serum (Gibco) or RPMI1640 Medium (Gibco) and 10% foetal calf serum (Gibco) and  
10 harvested in the logarithmic growth phase. Then the SK-UT-1B cells were placed in Cytostar  
® multi-well plates (Amersham) at a density of 4000 cells per well or 3000 cells per well for  
NCI-H460 cells and incubated overnight in an incubator. Various concentrations of the  
compounds (dissolved in DMSO; final concentration: 0.1%) were added to the cells. After 48  
hours' incubation,  $^{14}\text{C}$ -thymidine (Amersham) was added to each well and incubation was  
continued for a further 24 hours. The quantity of  $^{14}\text{C}$ -thymidine which was incorporated into  
15 the tumour cells in the presence of the inhibitor and which represents the number of cells in  
the S phase was measured in a Wallace 1450 Microbeta Liquid Scintillation Counter.  $\text{IC}_{50}$   
values for the inhibition of the proliferation (= inhibition of incorporated  $^{14}\text{C}$ -thymidine) were  
calculated, correcting for the background radiation. All the measurements were done twice

## 20 Test 2

### In vivo effects on tumour-bearing nude mice

$10^6$  cells [SK-UT-1B, or non-small cell lung tumour NCI-H460 (obtained from ATCC)] in a  
volume of 0.1 ml were injected subcutaneously into male and/or female nude mice (NMRI  
25 nu/nu; 25-35 g; N = 10-20); alternatively, small fragments of SK-UT-1B or NCI-H460 cell  
clumps were implanted subcutaneously. One to three weeks after injection or implantation an  
inhibitor was administered orally (by oesophageal tube) daily for a period of 2 to 4 weeks.  
The tumour size was measured three times a week using a digital sliding gauge. The effect of  
a compound on the tumour growth was determined as a percentage inhibition compared with  
30 a control group treated with placebo.

The following Table contains the results obtained with the *in vitro* Test 1 (++ denotes  $<0.01 \mu\text{M}$ , + denotes  $0.01-1.0 \mu\text{M}$ ):

## Examples 171 to 206

The compounds of formula IB of Examples 171 to 196 listed in the following Table IV are  
 5 obtained from compounds of the abovementioned Examples 1 to 170 by the following general methods A to E:

A: Cleaving of tert.butoxycarbonyl:

0.6 mmol of the starting compound are dissolved in 5 ml of dichloromethane. 10 ml of ethyl  
 10 acetate/HCl are added and the mixture is stirred for 2 hours at ambient temperature. Then a basic pH is obtained by the addition of sodium hydroxide solution. The organic phase is washed with water, dried over sodium sulphate and the solvent is eliminated *in vacuo*. In order to prepare hydrochlorides the addition of sodium hydroxide solution is omitted. In order to prepare hydrotrifluoroacetate, trifluoroacetic acid is added to the solution of the starting  
 15 compound

B: Cleaving of benzyl:

1.5 mmol of the starting compound are dissolved in 20 ml of dichloromethane/methanol (1:1).  
 100 mg of palladium/charcoal (10%) and 1.5 ml of 1 N hydrochloric acid are added and the  
 20 mixture is then hydrogenated in a hydrogen atmosphere at 50 psi. The catalyst is suction filtered and the filtrate is evaporated to dryness. The residue is chromatographed on silica gel (dichloromethane/methanol/NH<sub>4</sub>OH, 9:1:0.1)

C: hydrogenation of cyano to CH<sub>2</sub>NH<sub>2</sub>:

25 0.5 mmol of the starting compound are dissolved in 20 ml of methanolic ammonia solution and combined with Raney nickel. The mixture is hydrogenated in a hydrogen atmosphere of 50 psi, then the catalyst is suction filtered and the solvent is eliminated *in vacuo*. The residue is chromatographed on silica gel (dichloromethane/methanol/NH<sub>4</sub>OH, 9:1:0.1).

D: hydrogenation of nitro to amino:

30 0.2 mmol of the starting compound are dissolved in 20 ml of ethyl acetate/methanol (1:1). Then the mixture is hydrogenated analogously to Method C over Raney nickel. The residue is optionally chromatographed on silica gel (dichloromethane/methanol/NH<sub>4</sub>OH, 9:1:0.1).

a. (Z)-1-acetyl-3-(1-ethoxy-1-phenyl-methylidene)-5-(N-methyl-N-phenylsulphonyl-amino)-2-indolinone

10 g (20 mmol) of 1-acetyl-3-(1-ethoxy-1-phenyl-methylidene)-5-(N-acetyl-N-phenylsulphonyl-amino)-2-indolinone (Example 1e) are dissolved in 150 ml of DMSO and combined with 2.2 g (20 mmol) of potassium tert. butoxide with stirring. After 15 minutes' stirring 1.9 ml (31 mmol) of iodomethane are added. The mixture is stirred for 3 hours at ambient temperature. Then another 2.2 g (20 mmol) of potassium tert. butoxide and 1 ml (16 mmol) of iodomethane are added. The mixture is stirred for 18 hours at ambient temperature. Then water is added. The reaction mixture is extracted with ethyl acetate. The organic phase is washed with water, dried over magnesium sulphate and evaporated to dryness. The residue
